TULU KAPI GOLD PROJECT: A HISTORY OF “REPEATED” DISCOVERIES IN WESTERN ETHIOPIA

Fabio Granitzio, Jeff Rayner (presenter), Tadesse Aregay
The information contained in this document ("Presentation") has been prepared by KEFI Minerals plc (the "Company"). While the information contained herein has been prepared in good faith, neither the Company nor any of its shareholders, directors, officers, agents, employees or advisers give, have given or have authority to give, any representations or warranties (express or implied) as to, or in relation to, the accuracy, reliability or completeness of the information in this Presentation, or any revision thereof, or of any other written or oral information made or to be made available to any interested party or its advisers (all such information being referred to as "Information") and liability therefore is expressly disclaimed. Accordingly, neither the Company nor any of its shareholders, directors, officers, agents, employees or advisers take any responsibility for, or will accept any liability whether direct or indirect, express or implied, contractual, tortious, statutory or otherwise, in respect of, the accuracy or completeness of the Information or for any of the opinions contained herein or for any errors, omissions or misstatements or for any loss, howsoever arising, from the use of this Presentation.

This Presentation may contain forward-looking statements that involve substantial risks and uncertainties, and actual results and developments may differ materially from those expressed or implied by these statements. These forward-looking statements are statements regarding the Company's intentions, beliefs or current expectations concerning, among other things, the Company's results of operations, financial condition, prospects, growth, strategies and the industry in which the Company operates. By their nature, forward-looking statements involve risks and uncertainties because they relate to events and depend on circumstances that may or may not occur in the future. These forward-looking statements speak only as of the date of this Presentation and the Company does not undertake any obligation to publicly release any revisions to these forward-looking statements to reflect events or circumstances after the date of this Presentation.

This Presentation should not be considered as the giving of investment advice by the Company or any of its shareholders, directors, officers, agents, employees or advisers. Each party to whom this Presentation is made available must make its own independent assessment of the Company after making such investigations and taking such advice as may be deemed necessary.

Neither this Presentation nor any copy of it may be (a) taken or transmitted into Australia, Canada, Japan, the Republic of Ireland, the Republic of South Africa or the United States of America (each a “Restricted Territory”), their territories or possessions; (b) distributed to any U.S. person (as defined in Regulation S under the United States Securities Act of 1933 (as amended)) or (c) distributed to any individual outside a Restricted Territory who is a resident thereof in any such case for the purpose of offer for sale or solicitation or invitation to buy or subscribe any securities or in the context where its distribution may be construed as such offer, solicitation or invitation, in any such case except in compliance with any applicable exemption. The distribution of this document in or to persons subject to other jurisdictions may be restricted by law and persons into whose possession this document comes should inform themselves about, and observe, any such restrictions. Any failure to comply with these restrictions may constitute a violation of the laws of the relevant jurisdiction.
ABOUT KEFI MINERALS PLC

Focused on gold & copper in the under-explored Precambrian Arabian-Nubian Shield (ANS)

Principal projects: **Tulu Kapi** gold deposit in Ethiopia and **Jibal Qutman** gold deposit in Saudi Arabia;

**ETHIOPIA (TULU KAPI: KEFI 75% AND THE GOV’T 25%):**

**Tulu Kapi** finalizing financing for **construction** 2018-19;

Indicated & Inferred Resource is **20.2 Mt @ 2.65 g/t Au** for **1.72 Moz**; open pit **Ore Reserve of 1.05 Moz Au**;

A high grade resource under the open pit is open along strike and presents a **potential underground mine**;

**Open pit 144koz pa + underground lifts to c.200Koz pa**

A large **EL (1000Km²)** containing a number of shear hosted gold and VMS deposits is reserved for KEFI for potential sources of **additional mill feed** at Tulu Kapi;
SAUDI ARABIA : GOLD & MINERALS JV ARTAR 60% TO KEFI 40%

Mining Licence Application (MLA) at Jibal Qutman to develop an initial 200,000 oz Au heap leach mine to treat oxide ore. Total Mineral Resources are 28.4Mt at 0.80g/t gold for 0.73 Moz Au. There is potential to increase oxide resources to +1-2Moz in 4 adjacent ELAs.

A further 15 Exploration Licence applications (ELAs) have been lodged over outcropping Au and Au-BM targets, all of which have historic workings for Au or VMS Cu-Au.

KEFI has a large database of over 5000 mineral occurrences in ANS, enabling quick quality selection, and a +100km long VMS mineral belt

Hawiah VMS, 6 Km long and up to 40m wide. Surface channel sampling returns up to 24g/t Au. 2km long +125mV SP anomaly. Plan to drill in H1-2018.
In 2012, KEFI in the G&M JV in Saudi Arabia discovered new gold mineralisation associated with albite alteration at the contact and within felsic to intermediate dykes at its Selib North project. Best trench results included 17m @ 3.4 g/t Au. Follow up drilling in early 2013 returned best results 11m @ 3.11g/t Au;

The prospect was not big enough for “stand-alone”, but the association of Au with anomalous Na led KEFI to re-examine all Au and ICP results from sampling work in KSA;

This turned up many new minor discoveries amongst what seemed to be isolated anomalies in the geochemical data base and was the initial reason KEFI was to later focus on the Tulu Kapi deposit in Ethiopia;
Queen of Sheba

A local prospector led British archaeologist Dr. Louise Schofield to a mysterious mine in Ethiopia’s northern Tigray region. Schofield believes that this was the source of the Queen of Sheba’s **fabulous gold**, a large pile of which she gave to **King Solomon** when she visited the Holy Land, as is reported in the Old Testament, the Koran, and the Kebra Nagast, one of the holy books of the Ethiopian Orthodox

(https://gadling.com/2012/02/13/queen-of-shebas-gold-mine-discovered-in-ethiopia/)
The Tulu Kapi gold project is located in the West Oromia region of Ethiopia, approximately 550km west of Addis Ababa;

Tulu Kapi has had a stop-start history of exploitation due to its modest grade in ancient times, wars, civil uprising, communist regimes, the collapse of the gold price in the late 1990s and, most recently, over-capitalisation of the project in times of gold price instability;

**Tulu Kapi has been “re-discovered” several times** through the 20th and 21st centuries. At the start of the 20th Century these East African regions were the centre of a gold rush;

In Egypt and Sudan, a number of mining companies were operating, while in Ethiopia in 1901 the company **Mines d’or du Wallaga**, with capital of one million francs, was established in Antwerp and listed on the stock exchange;
In 1935, Fascist Italy invaded Ethiopia, commencing a war which ended with the annexation of the country to the Italian Colonial Empire, but only briefly until 1941;

In 1936, the Colonial Mining Service (SMC) was set up to carry out rapid exploration of Ethiopia. Western Ethiopia was entrusted to S.A.P.I.E. (Italian mining company);

The activities of S.A.P.I.E. at Tulu Kapi were mainly focused on the exploitation of the “placers”. Eluvial and alluvial gold mining took place in a number of nearby places including Ankorì, Komto, Yaven, Buneya and KEFI’s tenements;

Gold recovery using gravity methods was also made possible thanks to the construction of a canal network;
In 1939, S.A.P.I.E. reported reserves of c. 37,000 oz Au in alluvials, saprolite and in quartz veins at Tulu Kapi (UNDP, 1980);

The area of saprolite mining is located in the centre of the planned open cut at Tulu Kapi;

Italian mining initiatives however registered high production costs due to higher transport costs, fuel and electricity and the need to pay for transit rights through the Suez Canal for transport to Italy;

Italian exploitation of Tulu Kapi ceased in 1941. There is no news of gold mining exploitation by the British liberators;
1934 – 1941: ITALIAN MINING ACTIVITY: S.A.P.I.E.

Figure 2: The map to the left shows the dislocation of S.A.P.I.E. Exploration Corps in western Ethiopia (from “Giacimenti Auriferi nell’Uollega e nel Beni Scianguli”, S.A.P.I.E., 1938). In a paragraph the book reports: “During the rainy seasons, the exploration corps, reduced to eight, were located: two at Yubdo’s mining district (platinum) for the elaboration of the obtained results and completion of the geological and mineralogical studies, while the other six were based in Cata, Gordoma, Tullu Capi-Gulissó (Tulu Kapi), Uabera and Buré, for the continuation of the exploration and organization of semi-industrial and indigenous exploitation under the supervision of SAPIE technicians”. Map to the right: gold occurrences and producing mines plotted on a simplified map of Precambrian geology of Western and Southern Ethiopia (after Johnson et al. 2017).
“Perforation by drilling on the research of a vein”

Figure 8: 1938 Geological sketchmap of Tulu Kapi (after ‘La geologia della regione di Tulu Kapi, Ovest etiopico – Wallega. A. Pollini thesis, 1938)
EXPLORATION TECHNOLOGY & MINING INFRASTRUCTURE

“local labour digging a trench for research”

Construction of a water canal, presumably from the Birbir River to Tulu Kapi
Modern exploration and prospecting works started in the area after the creation of the **Geological Survey of Ethiopia** in 1968. Reconnaissance and detailed mapping and mineral surveys were carried out by the **United Nations Development Program (UNDP)** from 1969 to 1972;

These were the first important reported works which outlined the **“Nejo-Yubdo” mineralised belt**, including the Tulu Kapi deposit and many other sites of historical and active alluvial, eluvial and hard rock gold mining;

At Tulu Kapi, **UNDP drilled** three diamond holes for a total of 362m immediately north of the planned open pit, and reported **hard rock gold mineralisation** in the area for the first time. The best gold intersections in diamond holes include 0.7m @ 27 g/t gold (BH-10) and **26.2m @ 2.8 g/t** (BH-11) associated with altered syenite with disseminated sulphide and quartz veins;

**Geological and exploration activities in Ethiopia ceased from 1973 to 1996**, during the socialist regime (1974-1993) which saw periods of war (with Somalia and Eritrea), civil war and famine;
In 1996, Canadian company Tan-Range Resource (TRR) was granted the first privately owned exploration licence in the Tulu Kapi area. Despite encouraging surface and test drilling results, TRR abandoned the licence area in 1998, possibly due to a significant drop in the gold price.

The exploration and prospecting results of UNDP and TRR were the basis for Golden Prospect Mining Company (GPMC) to apply for the Tulu Kapi-Ankori exploration licence, which was converted later (in April 2015) by KEFI to a large-scale gold mining licence.
“The discovery”: GPMC (May 2005 to August 2009)

Golden Prospect Mining Company (GPMC), acquired the exploration licence (20sq km), in May 2005. At Tulu Kapi GPMC carried out further detailed exploration including geological mapping, trenching, and ground geophysics (IP-Resistivity), and conducted three drilling phases for a total of about 6,908m over 34 diamond drill holes (TKBH_001 to TKBH_034) using a 80m by 80m grid layout;

The “discovery hole” TKBH_004, 37m @ 4.61 g/t Au, was made in Phase one and encouraged further funding for drilling in the area;

Nyota Minerals (2009-2013). Minerva, GPMC’s parent company, was acquired by Nyota Minerals Ltd in July 2009. Immediately after the takeover, a maiden inferred resource of 690,000oz gold was independently estimated by Hellman & Schofield Pty. Ltd (H&S) in September. Nyota carried out systematic exploration at Tulu Kapi, performing an early trenching programme (234m); 42,000km-lines of airborne geophysics (magnetics and radiometrics) covering all licences and ground magnetic and IP-resistivity surveys;
By Dec 2012, Nyota had drilled a total of 305 diamond holes for 71,015m and 401 RC holes for a total of 51,543m, including 70 hydro RC holes totaling 6,202m, and excavated 16 trenches for a total length of 349m and had spent a total of ca. US$50M;

The **Oct 2012** resource estimate was based upon 189 diamond holes and 302 RC holes totaling 86,873m. The resource comprised **14.6mt @ 2.36 g/t for 1.11 Moz (indicated)** and **10.3mt @ 2.3 g/t for 764,000oz (inferred)**, using a 0.5 g/t gold cut-off;

Deeper drilling discovered a high-grade “**feeder zone**” at depth, immediately below the planned open cut: drill hole TKBH-074 intersected **25.7m @ 23 g/t**. The high-grade gold mineralisation remains open along strike, down plunge and at depth. Notably, the most northerly hole drilled into the deepest portion of the deposit intersected **90m @ 3 g/t** gold;

Nyota completed the DFS in December 2012 and submitted it to the Ministry of Mines in 2013. The DFS evaluated construction of a 2 Mtpa CIL processing plant and estimated initial **capital expenditure of US$289 million**, including an allocation for working and sustaining capital. The gold price reached US$1,800/oz in 2012 and the DFS was based on a gold price of US$1,500/oz. But the gold price declined rapidly in 2013 to close the year at US$1,200/oz. Unable to finance, Nyota could not apply for a Mining Licence and was forced to sell out;
KEFI Minerals (December 2013 to date)

The “discovery” by KEFI was essentially one of geological interest as KEFI had discovered several new gold occurrences in its JV exploration properties in Saudi Arabia that were associated with felsic dykes and albite alteration. A search of similar styles of mineralisation led to the company geologists to research the Tulu Kapi deposit in early 2013;

The decline of the market capitalisation of Nyota soon after the announcement of the DFS and its 2 Moz @ 2.3 g/t Au Resource led KEFI to approach the vendor for a business arrangement in mid-2013. Due diligence showed that capital costs could be significantly lowered for mining infrastructure, equipment and plant, and a switch to contract mining rather than owner-operated mining;

Furthermore, some selective mining was possible as a means of minimizing ore dilution thanks to the distinction in colour between ore (white albite alteration) and waste (green);

KEFI acquired 100% project ownership from Nyota in two tranches; 75% in December 2013 and the remaining 25% in September 2014. The Government of Ethiopia is entitled to a 5% free-carried interest in an operating mine;
KEFI’s subsequent **desk-top study in 2013** confirmed KEFI’s earlier notion that the Tulu Kapi deposit should be an economic 1Moz Au open cut mine. The 2012 DFS had a reasonable SR of 9:1, metallurgical recoveries of 93%, cheapest electricity in the world (3c/kWh), and reasonably close to major infrastructure and supply centres;

KEFI has confirmed its initial findings and completed a new **DFS in 2015**;

KEFI has succeeded in **upgrading** the **Resource Model** and **Ore Reserves**, and significantly **lowering costs** for **Capex** from the previous vendor’s $290M to **$180M**;

At **$1,250 oz Au price**, projected cash flow is **$74M pa before debt service & tax**;

Unit Costs are AISC c. $800/oz and AIC c. $933/oz, which is in the best quartile globally;
After acquiring Tulu Kapi in December 2013, KEFI reviewed and interpreted the extensive previous data assembled, carried out trenching and limited drilling to increase geological understanding and to verify the previous resource model;

In March 2014 using the same resource estimation methodology of the vendor, KEFI was able to upgrade the Indicated Resource by 68% to 21.2mt @ 2.73 g/t for 1.86 Moz gold (from 1.11 Moz @ 2.36 g/t) by updating the database to include a total of 71 infill holes drilled by Nyota in late 2012 after the October 2012 DFS resource estimate;

As a result of upgrading the Indicated Resource, the Inferred Resource was reduced to 2.9mt @ 2.03 g/t for 189,000oz gold (from 764,000oz @ 2.30g/t);
To support this new resource estimate and geological interpretation, KEFI carried out trenching and RC drilling from Feb to May 2014. 82 trenches (1,050m) and 30 RC holes (4,283m) in the open pit area;

Results confirmed the north-east strike continuity of mineralisation. The individual vein zones can be traced for up to 200-400m along strike at surface and up to 500m down dip in drilled sections;

In August 2014, Snowden Consultants performed an independent resource estimate using ordinary kriging with dynamic anisotropy to align the local strike and dip of the mineralised trends and confirmed KEFI’s previous March resource estimate;

In February 2015, Snowden confirmed an updated resource at a 0.3g/t gold cut-off by KEFI which incorporated wire framing of the mineralised lodes to improve the confidence in the geological model. The main difference in this estimate and the August 2014 estimate is a lower inferred resource, the indicated remaining the same at slightly higher grade and total ounces;

Total Resource is 20Mt at 2.65g/t Au, 1.72oz and Reserves of 15Mt at 2.12g/t Au, 1.05Moz.

KEFI pursued an alternative approach for Tulu Kapi aimed at significantly reducing the anticipated aggregate capital and operating expenditure, which provides less start-up risk and a higher overall return. Further refinements since the 2017 DFS Update further lifted annual processing capacity along with EBITDA and other estimates.

All-In Costs are All-In Sustaining Costs plus initial capital expenditure divided by gold production over life of mine
The Tulu Kapi region has typical Precambrian geology which is characterised by prominent hills of intrusive rocks and deeply incised valleys containing meta-sediments and metavolcanic rocks;

At Tulu Kapi gold is hosted in quartz-albite alteration zones as stacked sub-horizontal lenses in a syenite pluton into which a swarm of dolerite dykes and sills have been intruded. Gold mineralisation extends over a 1,500m by 500m zone and is open at depth;

The mineralisation is characterised by a simple mineralogy comprising gold, silver, pyrite and minor sphalerite and galena. The gold is free milling with metallurgical recoveries averaging 93% for oxide and sulphide ore in the planned open pit;

Figure above shows a simplified version of the vein swarm and a zone adjacent to the Bedele Shear Zone that is characterised by significantly higher gold grades, with occasional coarse visible gold, more base metal sulphides. It was initially called a “feeder zone”, but more likely just a higher grade zone of the stacked Qtz-Ab vein system.
Tulu Kapi deposit comprises a series of stacked gold bearing quartz-pyrite-carbonate veins within albite altered zones that dip 20-30° WNW.

Section looking to 025

High Grade Mineralization below the pit

Stereographic plot:
(A) Pole to mineralised veins Max= 030/27NW
(B) Pole to mineralised shears (015/22 NW)
The mineralisation commonly occurs in veins, crackle zones and minor breccia zones. The typical Tulu Kapi gold mineralisation is associated with sulphide-bearing albite alteration and quartz veins (replacement and fracture fillings). Albite occurs as overgrowths on original syenite feldspar and also as newly formed crystals in veins and cavities.

Figure 11: Quartz and pyrite in albitised syenite overprinted by a shear fabric. GKP-11. (photo Pollard, 2008)

Figure 13: Albitised syenite cut by a vein with quartz, carbonate and pyrite. Core specimen TKBH-010 (photo Pollard 2008)

Figure 16. Hand Specimen. Albitised syenite (white) with quartz vein and sulphide overprint. WOF c5.0cm. Slab (Taylor, 2008)

Figure 17. Specimen from interval with 8.85 g/t Au. Albitised syenite (white) with sulphide overprint. WOF 5.0cm. Slab. (Taylor, 2008)
• Sulphides represented mainly by pyrite often associated with Ilmenite, lesser marcasite bornite, sphalerite, galena and trace of chalcopryte & arsenopyrite

• Lack of considerable arsenic, antimony and tellurium minerals suggest that the majority of gold could found as a free gold
Further research for similar deposit styles in Saudi and the ANS resulted in KEFI’s attention on the Tulu Kapi prospect in Ethiopia.
The underground provides strong upside

Thick, high-grade gold zones below open pit

Preliminary studies based on current resource only:

- Open Pit + Underground production ≈ c. 200Koz pa
- Additional NPV$_{8\%}$ ≈ $23M (at $1,200/oz$
- Low AISC of c.$845/oz for underground
- Mineable resource outside open pit is Gold 1.3Mt @ 5.2g/t Au containing 220Koz
- Mineralisation open at depth, along strike and down plunge
- Gold grades increase and ore lenses thicken with depth
- Gold mineralisation is expected to extend deeper and +800m further north
- Potential to mine 1Moz below open pit

1) Resource blocks below open pit: >1.5g/t Au (yellow) >5g/t Au (pink)

**REGIONAL EXPLORATION: GUJI**

VG in Guji drill sample

Limonitised quartz stockwork: Komto primary gold mineralisation
Eight gold targets proximal to Tulu Kapi (from 2 to 15 km) with significant and encouraging trench and drill intersections

Longer term target to increase Tulu Kapi Mine life

High grade copper in new VMS prospect within 50km of Tulu Kapi Mining Licence;

United Nations identified 6 new Cu bearing gossans in 1974 and drilled 6 diamond drill holes in the 1970’s over a 600m strike in one gossan;

Best intercept of **14.3m at 3.2% Cu** at end of hole;

The **gossan is 30m wide**, is open along strike and depth. Soil geochemistry defines a +2km copper anomaly. Gold was not assayed;

Potential for 10-20Mt at 1.5% Cu
Artisanal mines, prospects and major Au and Cu deposits in Ethiopia

- Highly prospective - limited modern exploration
- Lege Dembi is the only operating Au mine
- Dish Mountain and Ashashire represent an undeveloped +2Moz Au district
- East African’s high-grade Au and Cu at Terakimti and Adyabo are at feasibility stage
- KEFI is targeting gold, base-metals and strategic metals throughout Ethiopia
- Strong support and investment from Ethiopian Government
Discovery of Tulu Kapi was a culmination of many factors over a long period of time. The Arabian-Nubian Shield was long known to host many thousands of gold and base metal occurrences and was a good place to explore, which brought the initial Italian interest.

The long history of discovery involved at least seven entities; S.A.P.I.E, UNDP, GSE, Tan Range, Minerva, Nyota and KEFI over circa 80 years.

World wars and politics and gold price retarded recognition of the resource potential until the multi-million ounce potential was realised in 2009-2010.

KEFI’s interest and 100% acquisition of the Tulu Kapi started in 2013 with researching other gold deposits in the ANS associated with albite alteration and having an experienced team recognising that the project could be made to be a viable and profitable gold mine.

KEFI has over-hauled the project and reduced Capex from the previous vendor’s $290M to $180M and is in the advanced stages of financing the project and planned construction to start in H1 2018.

At $1,250 oz Au price, DFS-level cash flow is $55M pa before debt service & tax over 8 years. Recent revised plan to increase annual throughput by 25% lifts EBITDA to $74M and improves other economics

Unit Costs are AISC ca. $800/oz and AIC ca. $933/oz, which is in the best quartile globally.
